Olive cosmetics series
All extra virgin DOP

Olive oil is rich in Polyphenolen, an effective biological substance full of antioxidants which protects the body from the detrimental effects of oxygen radicals. Polyphenolen prevents the oxidation of the LDL cholesterol and through this blocks the emergence or progression of arteriosclerosis and other grave serious illnesses. Generally antioxidative substances, like Polyphenolen, have a protective effect on the cells of the body protectively and delay the ageing process. Antioxidants also help to prevent many other illnesses. All extra virgin DOP.

Olive products of the highest quality from Apulia (Italy) ! For high-quality food preparation, improving your physical well-being and boosting your immune system! The 'golden' olive trees of Apulia are grown and cultivated on one of the Earth's most fertile soils. Top products like high-quality olive oil, olive oil marinated vegetables or fish are produced from a variety of olives.

Olive is also the best cosmetic ! Olivo d'Oro sells best cosmetics series ! All extra virgin DOP.

Telecom
Perfect location for logistics and distribution centers

Austria's ICT companies generated revenues of EUR 11.5 billion in 2009. This figure would swell to EUR 30 billion if downstream sectors such as consulting, advertising and media were included. Some 15,000 companies in Austria operate in the IT industry alone, employing 170,000 people. As a result, ICT is one of Austria's key business sectors, and is even bigger than the tourism industry when measured against the country's GDP.

The key to success. Competition and heterogeneity are typical features of the growing ICT market in Austria. In addition to major players such as Siemens, Infineon, Sony and Microsoft, Austria boasts specialized niche providers such as FaberSoft

companies, many of them spin-offs and temporary business or science partnerships ensuring creativity and dynamism on this market. Approximately 1.6 percent of the gross domestic product is being invested in ICT at the present time. On balance, total IT expenditures amount to EUR 10.1 billion and increasing steadily. On a medium-term basis, the industry expects annual growth of 4.4 percent.

ICT means research and development. Austria offers numerous direct and indirect funding and incentive programs for innovation-oriented companies. In addition to the excellent basic research being carried out, for example at universities or the Austrian Academy of Sciences (OAW), companies also profit from multi-disciplinary applied research and a dense network of internationally renowned competence centers, such as science and business

Austria
Factors

Logistics
Perfect location for logistics and distribution centers

Logistics is a decisive factor in selecting a business location. International companies such as Hewlett Packard, Intel, Hewlett-Packard, Fresenius Kabi and Charles Vögele have chosen Austria to serve as their distribution centers and logistics interfaces between West and East. Hewlett Packard has discovered that "Managing logistics for Eastern Europe is cheaper from Vienna than from Prague or Budapest. Transport services between the individual emerging CEE markets are still underdeveloped, but there is a frequent service each week to nearly every Eastern European destination from Vienna."

Austria is a global infrastructure leader. According to the Global Competitiveness Report, the quality of Austria's infrastructure is ranked among the top ten worldwide. Austria features an excellent network of intermodal transport and freight handling hubs. An inland harbor on the Danube with

links to the North Sea and Black Sea, railway connections to the large Adriatic harbors, Vienna as the interface for freight, especially to South East and Eastern Europe, as well as the excellent interaction of the transport carriers; most recently in the field of combined transport offer ideal pre-requisites for modern business operations.

Highest level of efficiency at reasonable prices. Rent for storage space in Austria has tended to decline in recent years, according to the real estate company CBRE Ellis, and now range from 4-5 euros per square meter, compares favorably with prices in neighboring European countries.

In the year 2011, approximately 511 million tons of goods were transported in Austria, of which 331 million tons were trucked on the country's roadways and 108 million tons by railway system. A further 10 million tons of freight are transported by ship, and 61 million tons via pipeline.
